ALCOHOLISM AND CIRRHOSIS OF THE LIVER

Death rates from alcoholism and cirrhosis of the liver in recent years are of particular interest in view of war-time prohibition measures and, later, national prohibition.

In the registration States of 1910 there was a declining rate from alcoholism from 5.5 per 100,000 population in 1910 to 1.2 in 1920, with an increase to 3.1 in 1932; the corresponding rates for the States of 1900 were 5.6, 1.2, and 3.4; for the States of 1910 there was a declining rate from cirrhosis of the liver from 13.3 in 1910 to 7.6 in 1920, with an increase to 8.4 in 1932; the corresponding rates for the States of 1900 were 14.4, 7.7, and 8.0.

For the 47 States in the death registration area in 1932, the death rate from alcoholism was 2.5 per 100,000 population, but of these States only 18 had rates in excess of the total rate. Nevada decreased from 12.0 to 5.4 (1931 to 1932) per 100,000 population from this cause. Cirrhosis of the liver shows a rate of 7.2 per 100,000 population.

Deaths from wood- and denatured-alcohol poisoning.—Table AR shows deaths and death rates from wood- and denatured-alcohol poisoning in the registration area. Prior to 1927 these deaths were not separately tabulated. In 1927 there were 230 deaths from wood-alcohol poisoning and 59 from denatured-alcohol poisoning; in 1928 the corresponding numbers were 236 and 72; in 1929, 204 and 47; in 1930, 316 and 137; in 1931, 294 and 150; and in 1932, 237 and 81.
